

CS 161

Programming Lab 1

Instructions

Start a new project in Code::Blocks. This should give you a “hello world” program.

You are to modify this program so that it asks for a name (one word) and an age (integer). Then your program should output the name and age as shown in the following example (your output will be different):

What is your name?

Jim

What is your age?

99

Your name is Jim and your age is 99.

Make sure that you use two types of variables, one for the name and one for the age.

Your program should also have at least one comment explaining what it is doing.
